

Is the energy storage station considered a new energy source

Overview

New energy storage power stations represent a cornerstone of modern energy systems, particularly in the context of transitioning toward renewable energy sources. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to. An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. 1, These stations offer a sustainable solution to the intermittent nature of renewable energy sources, such as solar. As America moves closer to a clean energy future, energy from intermittent sources like wind and solar must be stored for use when the wind isn't blowing and the sun isn't shining. These facilities store excess electricity generated from renewables like solar and wind, then release it when demand spikes or supply drops. Think of them as the Swiss Army knives of modern.
