

Low-temperature server racks for wind power generation

Overview

The most commonly used methods are airside economization, direct-to-fan coolers, and hot aisle vented containment solutions. Each option has pros and cons, but all three provide highly effective rack cooling while reducing operating costs. Rack mount equipment generates heat as a result of the processes it completes; the amount of heat a piece of equipment dissipates is approximately equal to the total electrical power delivered to it. This heat is absorbed by the ambient air in the server, and removed by airflows generated by fans.
